

GROWING YOUR PUMPKINS!

The seeds you have to grow are **PUMPKIN HARVEST MOON**

Sow your seeds directly into the soil in late April, make a slight trench and sow the seeds about 20mm below the soil surface (You can start them off in pots and transplant as seedlings)

Ideally the seeds should be spaced about 80cm apart. Once sown, cover the seeds with soil before firming and then water.

Once the plants have emerged from the soil. Water to keep moist.

This variety will grow as neat plants and will not overrun your garden like other pumpkins. It will bring joy to all the family throughout the year not just at the end of October!
